## **ONLINE FOOD ORDERING SYSTEM**

### **Synopsis:-**

The aim of developing Online Food Ordering system project is to replace the traditional way of taking orders with computerized system. Another important reason for developing this project is to prepare order summary reports quickly and in correct format at any point of time when required.

Online Food Ordering System has a very lot of scope. This PHP project can be used by any restaurants or fast foods for customers for keeping their order records. This project is easy, fast and accurate. It requires less disk space. Online Food Ordering System uses MYSQL Server as backend so there is not any chance of data loss or data security.

### **CHARACTERISTICS OF THE PROJECT:-**

1. User Friendly: Online Food Ordering System is a very user friendly project because the Food Ordering Record and searching from categories is very simple, fast and data is secured. The user interface of the project is very simple.
2. Order reports of the system can be easily generated. User can generate the report of any particular date and period. In this way they can get delivery status of customers and get information about what is being ordered.
3. Very less paper work: Online Food Ordering System requires less paper work. In this project all record is fetched directly into the computer and reports can be generated through just a click. In this way it saves time. As data is directly entered into computer so there is no need to do any paper work.
4. Computer operator control: Online Food Ordering System is operated by the staff members and one admin so there is no chance of clerical mistakes. Data feeding and retrieving in this system is very easy. So the work can be done on time.

## **Software Requirements Specification**

### **Product Perspective**

The software described in this SRS is the software for a complete Restaurant food ordering system. The system merges various hardware and software elements and further interfaces with external systems. it relies on a number of external interfaces for persistence and unhandled tasks, as well as physically interfacing with humans

### **Product Functionality**

The Restaurant food ordering system interfaces with an existing payment system, including a cash register and software accessible credit system, in order to quickly and easily handle customer billing. The payment system should be operable such that it can return information to the RFOS system as to whether payment was successful or failed

### **Users and Characteristics**

There are three separate user interfaces used by the RFOS software, each related to an interfaced physical hardware device . These three user interfaces are the Surface Computer UI, Tablet UI and Display UI

### **Design and Implementation Constraints**

Constraints The RFOS should be written in an object-oriented language with strong GUI links and a simple, accessible network API. The primary candidate tool chains are Java/Swing, C++/Qt and Python/Qt. The system must provide a capacity for parallel operation and system design should not introduce scalability issues with regard to the number of surface computers, tablets or displays connected at any one time The system must be reliable enough to run crash and glitch free more or less indefinitely, or facilitate error recovery strong enough such that glitches are never revealed to its end-users.

### **External Interface Requirements**

#### 3.1.1. User Interfaces

User interface design is concerned with the dialogue between a user and the computer. It is concerned with everything from starting the system or logging into the system to the eventually presentation of desired inputs and outputs. The overall flow of screens and messages is called a dialogue.

## PROJECT PLAN:-

### Online Food Ordering System

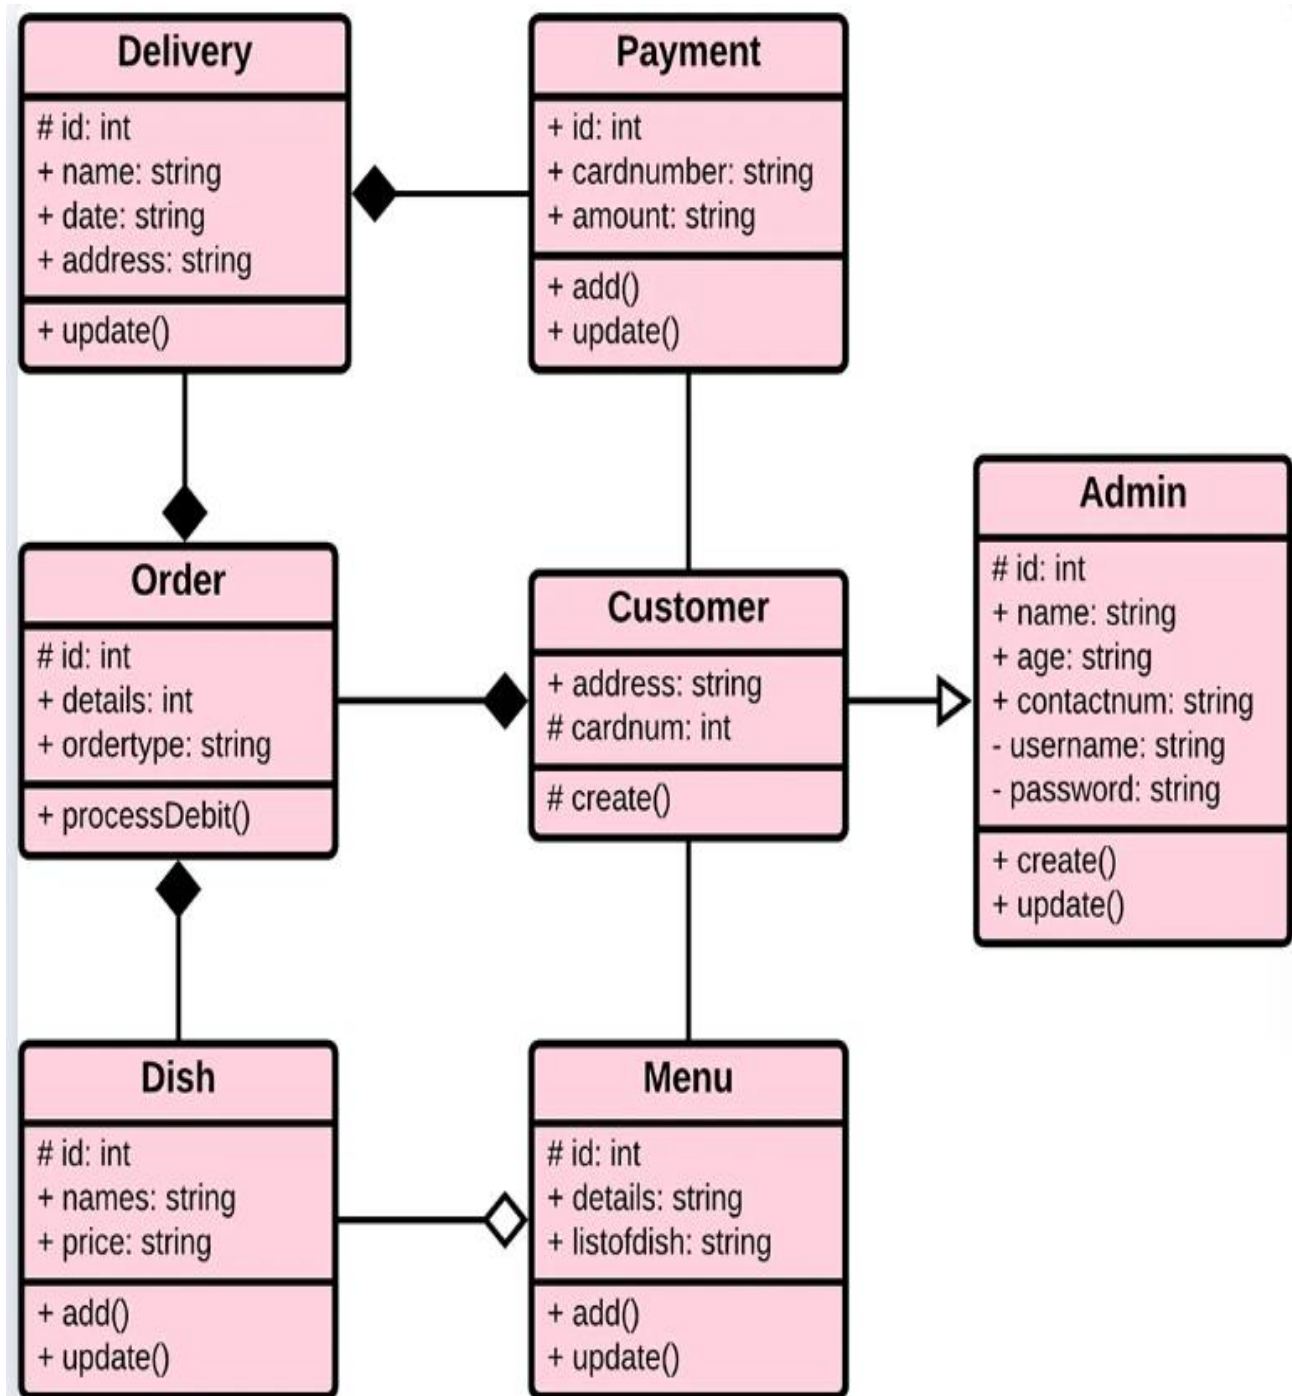

- ❖ Online Food Ordering System
- ❖ Online Food ordering system is a process in which one can order various foods and beverages from some local restaurant and hotels through the use of internet, just by sitting at home or any place. And the order is delivered to the told location.
- ❖ Nowadays everyone is having busy schedule whether it is urban area or rural. But talking specifically about the urban areas and deeply about the big cities, people out there are so busy in their life that they don't get enough of time to have their meals properly.
- ❖ As these days women are no less than men, in any field. So in big cities even wives are working women, therefore mostly the small families manage to have their food ordered from somewhere, as they lack time.
- ❖ Not only this is the case, if we talk about the children in the modern era they like only fast food or something from the outside. But they ignore eating homemade meals.
- ❖ So food ordering system these days has one of the fastest growing market, though being a new idea. In this project we have developed something like the same to earn from and serve the nation in a much better way possible.
- ❖ Nowadays, people are more regular to dine-in at restaurant for their meals. The online food ordering system provides convenience for the customers that are nothing special but the general busy people of the society.

## ONLINE FOOD ORDERING SYSTEM

---

- ❖ It overcomes the demerits of the manual hotel or mess system and the old fashioned queuing system. This system enhances the readymade of foods than people.
- ❖ Check online bus booking system
- ❖ Therefore, this system enhances the speed of getting food in person's plate and quality and manner of taking the order from the customer. It provides a better communication platform. The user's details are stored using the electronic media.
- ❖ The online food ordering system provides the menu online and the customers can easily place the order by just clicking the mouse or by touching a button on their smart phones.
- ❖ Also with the food ordering system online, people can easily track their orders, and admin can maintain customer's database and advance the food delivery system.
- ❖ This food ordering system allows the user to select the desired food items from a list of available menu items provided by the local hotel or restaurant. The user can place orders for the food items of their like from the list.
- ❖ The payment can be made online or pay-on-delivery system. The user's details are maintained confidential because it maintains a separate account for each user. An id and password is provided for each user.
- ❖ And several encryption techniques have also been used on the server side to protect the card details. Therefore it provides a more secured and safe ordering system.

## DESIGN DIAGRAMS

# ONLINE FOOD ORDERING SYSTEM

## TEST CASES:-

### Template of a Test case:

Test Case ID	Name of Module	Test case description	Pre-conditions	Test Steps	Test data	Expected Results	Actual Result	Test Result
01	<b>Search Functionality</b>	Validation that the restaurant name is searchable in the search text box.	Presents the visible restaurants near by customer	Validation that the dish name is searchable in the search text box.	Validation that matching suggestions should be shown when search items do not match any of the relevant records.	Shows the searching resturaunt and foods.	Shows the searching resturaunt and foods.	Shows the visilble items
02	<b>Home Page</b>	Validation that billing discounts should be displayed on the home page.	Presents the visible items in resturants	Validation that past orders should be shown on the home page for quick delivery.	Validation that restaurants should be shown on the home page as per distance from the delivery location.	Validation that the right delivery location should be shown	Validation that the filter and sort options on the home page. Filters options such as Cuisines and rating should be shown. Sorting of	Validation that history and donate options should be shown on the home page.

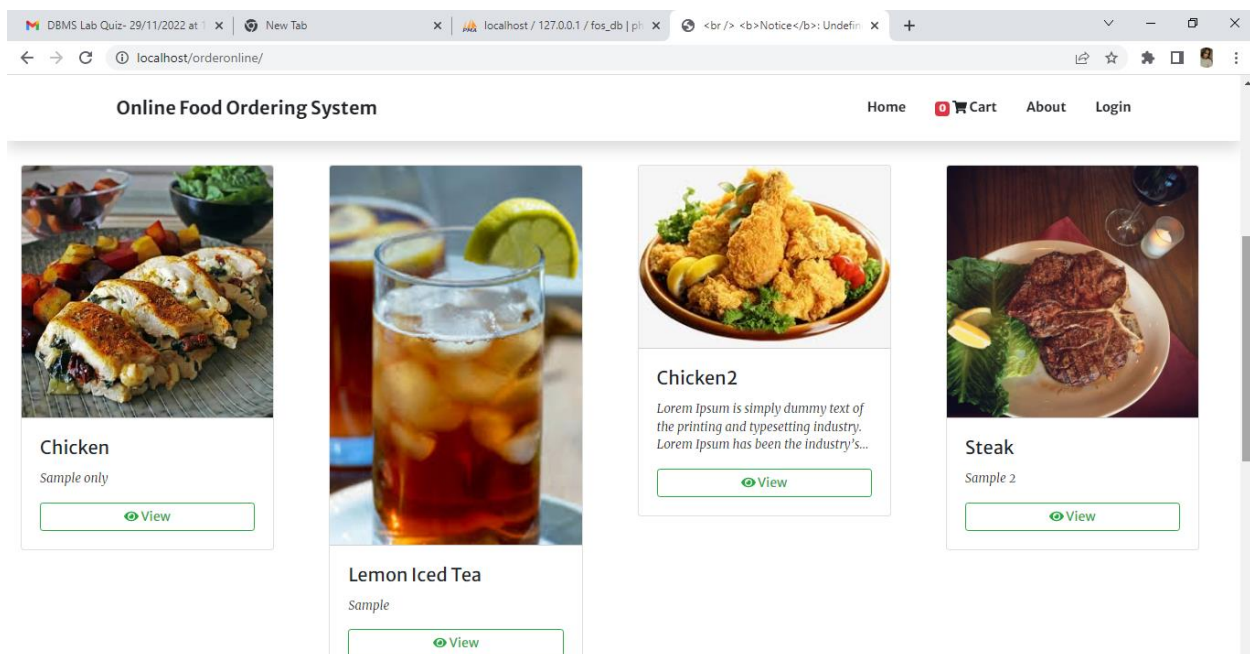

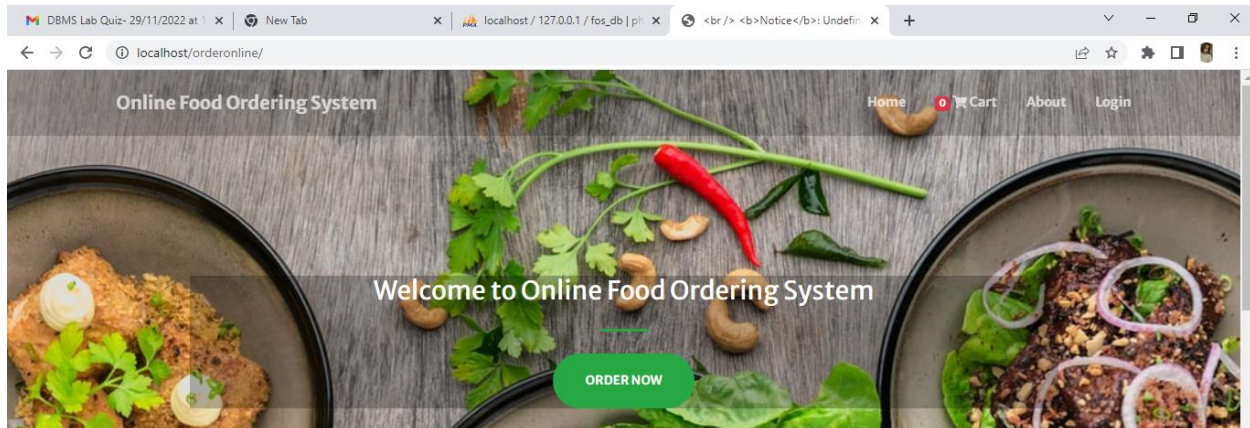

## ONLINE FOOD ORDERING SYSTEM

3	<b>Ordering Page</b>	Verify restaurant name and rating along with photos should be displayed clearly.	Verify reviews should be clearly shown so that people can order based on those.	Mode of delivery , approximate time of delivery , and offers should be shown clearly.	Verify add option should add the item to the cart.	Verify images should be correctly shown against the item	Verify recommended section should be displayed.	Verify recommended section should be displayed.
4	<b>Cart Page</b>	Verification that delivery location should be shown on the cart page.	Verify right items are displayed on the cart page.	Verify the option to delete the item is available.	Verify option to tip your valet should be available	Verify delivery location can be changed.	Verify pay using option should be shown.	Verify cart page can be minimized.
5	<b>Account Section</b>	Verify different account options should be shown for the user,	Verify help option should be shown In case any help is required .	Verify past orders, favorite orders, and address book can be accessed from the account section.	Verify help option should be shown In case any help is required .	Verify different account options should be shown for the user,	Verify about, send feedback, log out options should be displayed correctly	Verify different account options should be shown for the user,
6	<b>Registration and Login</b>	Verify users can log in to a Zomato account using a mobile number.	Verify users can log in via different options such as email and password, Facebook	Verify users can choose delivery locations upon successful registration.	Verify authentication is performed correctly when OTP is sent to the customer.	Verify users can choose delivery locations upon successful registration.	Verify authentication is performed correctly when OTP is sent to the customer.	Verify users can choose delivery locations upon successful registration.
